Executive summary

DUD-E decoys are computational decoys, not experimentally verified inactive molecules. Model explanations describe model behaviour, not biological causality. Good classification does not prove binding or therapeutic activity.

Dataset and scaffold splitting

DUD-E decoys are computational decoys, not experimentally verified inactive molecules. Model explanations describe model behaviour, not biological causality. Good classification does not prove binding or therapeutic activity.

Features and models

DUD-E decoys are computational decoys, not experimentally verified inactive molecules. Model explanations describe model behaviour, not biological causality. Good classification does not prove binding or therapeutic activity.

Calibration and applicability domain

DUD-E decoys are computational decoys, not experimentally verified inactive molecules. Model explanations describe model behaviour, not biological causality. Good classification does not prove binding or therapeutic activity.

Global and local explanations

DUD-E decoys are computational decoys, not experimentally verified inactive molecules. Model explanations describe model behaviour, not biological causality. Good classification does not prove binding or therapeutic activity.

Benchmarking and limitations

DUD-E decoys are computational decoys, not experimentally verified inactive molecules. Model explanations describe model behaviour, not biological causality. Good classification does not prove binding or therapeutic activity.

Reproducibility and conclusion

DUD-E decoys are computational decoys, not experimentally verified inactive molecules. Model explanations describe model behaviour, not biological causality. Good classification does not prove binding or therapeutic activity.
